## Floor fired storage machine

### Description of the machine

The SCT floor fired storage machine is made by one loading machine receiving the tiles arriving from the kiln, and deposit them, through a sucking system, on the floor. It also includes an unloading machine which takes the tiles deposited from the first machine feeding the following sorting line. Both machines can move on the floor on guides and have independent movements one in respect to the other. The system is extremely silent and flexible where tiles do not receive alterations as they remain on the floor.

The machine treats sizes from 20x20 up to 60x60; size changeover require small manual adjustments on the storage. The machine is equipped with electric installation with computerized logic. The length of the storage area is variable following the customer requirements.
